

The flexible tubes series OT are a suitable accessory for various designs of blowing nozzles, transducers or connecting pneumatic components with push-in fittings instead of conventional PU pipes. They are easy to shape by hand (minimum bending radius required) and hold the required shape, allowing air flow to be directed exactly where the various obstacles are needed or bypassed when connecting the fitting. The tube then retains this shape and direction even during use at high blowing pressures. It has a low weight - it only weighs a fraction of ordinary metal pipes. It does not need any special tools for cutting and can be cut with any conventional hose cutter.

## Technical specifications

Medium	.....	compressed air, water, emulsion
Working pressure	.....	max 10 bar
Working temperature	.....	-40°C to +80°C
Pneumatic connection	.....	any push-in fittings
Tube material	.....	aluminium alloy / PE
Hose length L	.....	according to customer requirements
